# Population Geography

## GEOG 3400/5400

Dr. Andrew Linke

Population geography is the study of the distribution and change of human populations, including population growth, fertility, mortality and migration. The utilization of quantitative and qualitative data at the local, regional, and global level allows population geographers to provide insight into individual behavior and global shifts. In this course we will use readings from textbooks, academic articles, and news media alongside statistics to discuss key global issues such as fertility, emerging and persistent infectious diseases, international migration, food security, the drivers and consequences of landscape change, and population policies and theories, among other issues.

(Tuesday and Thursday, 9:10 am to 11:30)
